present invention is applied to the electronic still camera, the present invention is not limited to the electronic still camera, but, for example, the invention can also be applied to a case in which a VTR is provided with an electronic shutter function for still photography.

As has been described heretofore, because the present invention is constructed such that, during the sequential photographing operation, the updating of the color temperature data to be used for the white balance adjustment is prohibited, according to the invention, the homogeneity of the main object can be maintained free from the variations of the color temperature of the field when photographing still images in the sequential photographic mode.

Also, due to the fact that in the present invention the response time, which extends from the detection of the field color temperature by the color temperature detection device to the execution of the white balance adjustment by the control device, can be altered, according to the invention, and the white balance can be adjusted properly according to the photographic modes.

It should be understood, however, that there is no intention to limit the invention to the specific forms disclosed, but on the contrary, the invention is to cover all modifications alternate constructions and equivalents falling within the spirit and scope of the invention as expressed in the appended claims.

What is claimed is:

A white balance adjusting device for use in a camera having at least a single photographic mode in which, when a shutter release operation is performed, an image of a field is picked up by a single frame and a video signal representing the still image thereof is formed and a sequential photographic mode in which, while said/shutter release operation is being performed, the images of said field are picked up sequentially for every predetermined period of time and video signals respectively representing the still images thereof are formed, said white balance adjusting device comprising: single/sequential photographic mode setting means for setting said single photographic mode and said sequential photographic mode;

operation means for performing said shutter release operation;

color temperature detecting means for detecting a color temperature of said field and outputting a color temperature signal representing said color temperature; and

control means for adjusting a white balance of said video signal in response to color temperature data that is obtained from said color temperature signal, said control means receiving a set output from said single/sequential photographic mode setting means and an output signal from said operation means and prohibiting said color temperature data that is used for adjusting said white balance from being updated when a sequential photographic operation is being performed.

2. A white balance adjusting device for use in a camera as set forth in claim 1, wherein said color temperature detecting means comprises:

a color temperature detection element for outputting a first photocurrent signal corresponding to an R component of an incident light from said field and a second photocurrent signal corresponding to a B component of said incident light;

a logarithmic conversion circuit for receiving a detection output from said color temperature detec-

tion element, compressing said detection output logarithmically and outputting an R signal and a B signal respectively corresponding to said R and B components of said incident light;

a subtraction circuit for calculating a difference between said R and B signals output from said loga-

£. =

rithmic conversion circuit; and an amplifier for amplifying a subtraction output signal from said subtraction circuit up to a predetermined level.

as set forth in claim 2, wherein said color temperature detection element comprises a first photo diode for receiving only said R component of said incident light from said field and a second photo diode for receiving only said B component of said incident light, wherein said first and second photo diodes are connected in said first and second photo diodes are connected in second to the said incident light, wherein said first and second photo diodes are connected in series to each other in such a manner that the respective cathodes thereof are directly connected to each other for allowing said first and second photo diodes to have mutually opposite polarities.

## 4. (Amended)

A white balance adjusting device for use in a camera in which a field is photographed and a video signal representing said field is formed, said device comprising:

photographic mode setting means for setting a still mode for 4 photographing said field as a still image and a movie mode for 5 photographing said field as a moving image; 6

color temperature detecting means for detecting a color temperature of said field and outputting a color temperature signal representing said color temperature; and

control means for adjusting a white balance of said video signal in response to color temperature data that is obtained from said color temperature signal, said control means receiving a set output from said photographic mode setting means and adjusting said white balance of said video signal at a shorter cycle as compared with said movie mode when said camera is set in said still mode;

wherein when the still mode is set by the photographic mode setting means, the control means obtains the color temperature signal used for the white balance adjustment so that a first response time length between the detection of the color temperature by the color temperature detecting means and the white balance adjustment for the image signal of the still image is at most a predetermined time length;

wherein when the movie mode is set by the mode setting means, the control means obtains the color temperature signal from the color temperature detecting means so as to adjust the white balance of the image varies while the photographing of the moving image is continuously

performed in the movie mode, and the control means obtains the color

temperature signal used for the white balance adjustment so that a second

response time length between the detection of the color temperature by the

color temperature detecting means and the white balance adjustment for the

image signal of each of frames composing the moving image is longer than

the predetermined time length and is longer than a photographing cycle of

the frames composing the moving image.

- a color temperature detection element for outputting a first photocurrent signal corresponding to an R component of an incident light from said field and a second photo current signal corresponding to a B component of said incident light;
- a logarithmic conversion circuit for receiving a detection output from said color temperature detection element, compressing said detection output logarithmically and outputting an R signal and a B signal respectively corresponding to said R and B components of said incident light;
- a subtraction circuit for calculating a difference between said R and B signals output from said logarithmic ocnversion circuit; and
- an amplifier for amplifying a subtraction output signal of said subtraction circuit up to a predetermined level.
- 6. A white balance adjusting device for use in a camera as set forth in claim 5, wherein said color temperature detection element comprises a first photo diode for receiving only said R component of said incident light from said field and a second photo diode for receiving only said B component of said incident light, wherein said first and second photo diodes are connected in series to each other in such a manner that the respective cathodes thereof are directly connected to each other for allowing said first and second photo diodes to have mutually opposite polarities.

1 7. The white balance adjusting device for use in the camera as
2 defined in claim 4, wherein:

the color temperature detecting means sequentially detects color

temperatures of the field at a predetermined cycle and sequentially outputs

first color temperature signals representing the detected color temperatures;

and

when the movie mode is set by the mode setting means, the control means sequentially compares each of the first color temperature signals sequentially outputted from the color temperature detecting means with a second color temperature signal currently used for the white balance adjustment, and if color temperature change conditions in which a difference between the each of the first color temperature signals and the second color temperature signal is at least a constant value occur a first number of times, then the control means obtains a latest first color temperature signal and updates the second color temperature signal used for the white balance adjustment by the latest first color temperature signal.

signal.

8. The white balance adjusting device for use in the camera as 1 defined in claim 7, wherein when the movie mode is set by the mode setting 2 means, the control means sequentially compares each of the first color 3 temperature signals sequentially outputted from the color temperature 4 detecting means with the second color temperature signal currently used for 5 the white balance adjustment, and if color temperature changing conditions 6 in which symbols of the differences between the first color temperature 7 signals and the second color temperature signal are the same and absolute 8 values of the differences are at least the constant value occur sequentially 9 the first number of times, then the control means obtains the latest first color temperature signal and updates the second color temperature signal used for the white balance adjustment by the latest first color temperature

9. The white balance adjusting device for use in the camera as defined in claim 4, wherein when the still mode is set by the mode setting means, the control means compares a first color temperature signal outputted from the color temperature detecting means with a second color temperature signal currently used for the white balance adjustment, and if a color temperature change condition in which a difference between the first color temperature signal and the second color temperature signal is at least a constant value occurs, then the control means obtains a latest first color temperature signal and updates the second color temperature signal used for the white balance adjustment by the latest first color temperature signal.

signal and updates the second color temperature signal used for the white 13 balance adjustment by the latest first color temperature signal. 14

12. The white balance adjusting device for use in the camera as 1 defined in claim 4, wherein: 2 the color temperature detected means sequentially detects color 3 temperatures of the field at a predetermined cycle and sequentially outputs 4 color temperature signals representing the detected color temperatures; and 5 the white balance adjusting device further comprises a low-pass filter 6 to which the color temperature signals sequentially outputted from the color 7 temperature detecting means are added, the low-pass filter having a time constant larger than the predetermined cycle; and the control means obtains the color temperature signals via the low-

13. The white balance adjusting device for use in the camera as defined in claim 12, wherein when the still mode is set by the mode setting means, the control means changes the time constant of the low-pass filter to be smaller.

pass filter when the movie mode is set by the mode setting means.

14. The white balance adjusting device for use in the camera as defined in claim 4, wherein:

the still mode which is set by the mode setting means includes a single mode for photographing the field by a single frame and a sequential mode for sequentially photographing the field at constant intervals; and

- when the sequential mode is set by the mode setting means, the
- 7 control means prohibits updating the color temperature signal that is used
- 8 for the white balance adjustment at a photographing of a first frame during
- 9 the sequential photographing after the first frame.
